

In the Claims

Please amend the claims as follows:

1. (Currently Amended) A communication system for communication using wireless signals including down-link signals to and up-link signals from mobile stations, the system comprising [[,]]

a plurality of transceiver stations having broadcast channels and dedicated channels carried by said wireless signals,

measurement means to form ~~for forming~~ measurements of said wireless signals, and

zone manager means including,

processor means to process ~~for processing~~ said measurements ~~forming processor~~ ~~information~~ to determine preferred ones of said transceiver stations for particular dedicated channels for a particular mobile station, and

control means to ~~for~~ dynamically select ~~selecting~~ said preferred ones of said transceiver stations to provide said particular dedicated channels for said particular mobile station separately from one of said transceiver stations providing particular broadcast channels for said particular mobile station.

2. (Original) The communication system of claim 1 wherein said measurement means measures said up-link signals from said particular mobile station to form said measurements.

Amendment

-5-

09/750,592

3. (Currently Amended) The communication system of claim 2, wherein [[,]] said control means is responsive to said processed measurements ~~processor information~~ for changing said dedicated channels as frequently as a signal change time determined by a frequency of said up-link signals.

4. (Currently Amended) The communication system of claim 3, wherein said signal change time is associated with ~~approximately~~ an up-link signal frame rate of said up-link signals.

5. (Canceled)

6. (Currently Amended) The communication system of claim 3, wherein said signal change time is less than 1 second.

7. (Currently Amended) The communication system of claim 1, wherein said up-link signals from said particular mobile station are measurement signals occurring at a measurement signal rate of $1/T_1$ and wherein said processor means operates to [[,]]

~~to~~ generate said measurements at a rate of $1/T_1$,

~~to~~ integrate a plurality of said measurements over an integration length to form integrated measurement reports, and

~~to~~ form said integrated measurement reports using said processed measurements ~~processor information~~.

Amendment

-6-

09/750,592

8. (Original) The communication system of claim 1 wherein said zone manager means is formed of a plurality of zone managers, one for each of said transceiver stations.

9. (Original) The communication system of claim 8 wherein said zone managers are co-located with said transceiver stations at macrodiverse locations.

a4
cont
10. (Original) The communication system of claim 9 wherein said zone managers are interconnected with each other forming a network.

11. (Original) The communication system of claim 8 wherein two or more of said zone managers are co-located at a common location.

12. (Original) The communication system of claim 11 wherein said common location is a base station controller in a cellular system.

13. (Original) The communication system of claim 8 wherein said plurality of zone managers include a host zone manager and one or more assistant zone managers; said host zone manager operative to communicate over said particular broadcast channels with said particular mobile station while said particular dedicated channels for said particular mobile station are

Amendment

-7-

09/750,592

dynamically switched among said one or more assistant zone managers and said host zone manager.

14. (Original) The communication system of claim 13 wherein said measurement means includes a plurality of measurement units, one for each of said zone managers, where each measurement unit measures up-link traffic signals from said particular mobile station to form ones of said measurements as unit measurements.

Q4
Cont
15. (Currently Amended) The communication system of claim 13, wherein [[,]]
said transceiver stations include

a plurality of macro-diverse broadcasters distributed at macro-diverse broadcaster locations ~~for broadcasting to broadcast~~ said down-link signals, and include

a plurality of macro-diverse collector means distributed at macro-diverse collector locations ~~for receiving to receive~~ said up-link signals ~~and providing received signals for said particular mobile station,~~

said measurement means includes a plurality of measurement units, one for each of said zone managers, where each measurement unit measures up-link signals from said particular mobile station to form unit measurements representing the quality of said received up-link signals at one of said macro-diverse collector locations,

said processor means for [[a]] ~~said~~ host zone manager receives a plurality of said unit measurements and ~~operates for processing processes~~ said unit measurements to provide host

Amendment

-8-

09/750,592

~~processor information for determining~~ determine preferred ones of said broadcasters and preferred ones of said collectors for said particular dedicated channels for said particular mobile station, and

said control means for said host zone manager dynamically selects

said particular dedicated channels for said particular mobile station by selecting said preferred ones of said broadcasters to provide particular down-link signals, and ~~dynamically~~ selects

said preferred ones of said collectors to receive particular up-link signals for said particular mobile station.

16-24. (Canceled)

25. (Currently Amended) The communication system of claim 1, wherein said zone manager means is formed of a plurality of zone managers, one for each of said transceiver stations, each particular one of said zone managers having, ~~control means including,~~

a resource manager for managing available resources in said communication system,

an airlink controller for controlling the radio channels in said communication system, and

interface means for providing interfaces to ~~for said particular one of~~ said zone managers.

26. (Currently Amended) The communication system of claim 25, wherein said interface means includes a zone manager ~~zone manager to zone manager~~ interface manager for controlling ~~zone manager~~ links among ~~between~~ said zone managers.

27. (Currently Amended) The communication system of claim 25, wherein said interface means includes a transceiver interface for controlling a ~~transceiver~~ link between ~~from said particular one of said zone manager and managers to a~~ corresponding transceiver station.

28. (Currently Amended) The communication system of claim 25, wherein said communication system includes a controller link providing ~~having~~ an interface between a base station controller and some subset of one of said transceiver stations and ~~one of~~ said zone managers, ~~corresponding to said one of said transceiver stations, is in said controller link.~~

29. (Canceled)

30. (Original) The communication system of claim 25 wherein one or more of said zone managers is integrated into one or more of said transceiver stations.

31. (Currently Amended) The communication system of claim 1, wherein said control means includes

Amendment

-10-

09/750,592

broadcaster commands for controlling the down-link signals to each of selected ones of said mobile stations, and

collector commands for controlling the plurality of macro-diverse collectors for changing the up-link signals for each of other selected ones of said mobile stations.

32. (Original) The communication system of claim 1 wherein said wireless signals employ multiple access protocols.

24
cont

33. (Currently Amended) The communication system of claim 32, wherein said ~~wireless signals employ~~ multiple access protocols include at least some subset of TDMA protocols, CDMA, SDMA, and FDMA.

34-36. (Canceled)

37. (Original) The communication system of claim 1 wherein said transceiver stations communicate over a region containing one or more zones and said measurement means includes measurements from one or more collectors in said transceiver stations.

38. (Original) The communication system of claim 37 wherein said measurements from one or more collectors include radio link conditions between a mobile station and said one or more collectors.

Amendment

-11-

09/750,592

39. (Currently Amended) The communication system of claim 38, wherein said radio link conditions include at least some subset of path loss, forward error rates, and carrier to interference ratio.

40-41. (Canceled)

24
cont
42. (Currently Amended) The communication system of claim 37, wherein said measurements from one or more collectors are processed in the zone manager means related to said one or more base transceiver stations.

43. (Original) The communication system of claim 1 wherein said zone manager means includes a host zone manager and one or more assistant zone managers and said host zone manager processes said measurements from the one or more assistant zone manager means to provide processed measurements.

44. (Canceled)

45. (Currently Amended) The communication system of claim ~~[[44]]~~ 43, wherein said ~~processor information includes~~ processed measurements include at least some subset of priority

Amendment

-12-

09/750,592

levels for the communication links with mobiles, timing and synchronization information,
transmit power level, and locations of mobile stations.

46-48. (Canceled)

49. (Original) The communication system of claim 1 wherein said transceiver stations include broadcaster controllers for controlling broadcaster transmitters and said broadcaster controller selects one or more broadcaster transmitters for forward communications with mobile stations based on said processor information.

50. (Currently Amended) ~~In a communication system for communication~~ A method for communicating using wireless signals including down-link signals to and up-link signals from mobile stations, the method comprising [,.]

transmitting, from a plurality of transceiver stations, broadcast channels and dedicated channels over said wireless signals,

forming measurements of said wireless signals with measurement means, ~~with zone manager means,~~

processing, with processor means, said measurements ~~forming processor information~~ to determine preferred ones of said transceiver stations for particular dedicated channels for a particular mobile station, and

Amendment

-13-

09/750,592

dynamically selecting, with control means, said preferred ones of said transceiver stations to provide said particular dedicated channels for said particular mobile station separately from one of said transceiver stations providing particular broadcast channels for said particular mobile station.

51. (Currently Amended) ~~In the communication system~~ The method of claim 50, further comprising measuring said up-link signals from said particular mobile station to form said measurements.

52. (Currently Amended) ~~In the communication system~~ The method of claim 50, further comprising changing said dedicated channels as frequently as a signal change time determined by a frequency of said up-link signals.

53. (Currently Amended) ~~In the communication system~~ The method of claim 52, wherein said change time is associated with ~~approximately~~ an up-link signal frame rate of said up-link signals.

54-55. (Canceled)

56. (Currently Amended) ~~In the communication system~~ The method of claim 50 wherein said up-link signals from said particular mobile station are measurement signals occurring at a

Amendment

-14-

09/750,592

measurement signal rate of $1/T$ and wherein said processing operates, to generate said measurements at a rate of $1/T$, to integrating a plurality of said measurements over an integration length to form integrated measurement reports, to form said integrated measurement reports using said processor information.

57. (New) A communication system for providing wireless communications with mobile devices, the system comprising:

A4
cont
a plurality of transceiver stations to communicate with mobile devices, wherein the plurality of transceiver stations communicate via broadcast channels and dedicated channels, wherein one of the plurality of transceiver stations having best radio access to a first mobile device will be designated a host transceiver station for the first mobile device, and wherein the host transceiver will provide the broadcast channels for communication with the first mobile device; and

a plurality of processors associated with said plurality of transceivers to manage communications, wherein one of the plurality of processors associated with the host transceiver station will be a host zone manager for the first mobile device, wherein the host processor is capable of dynamically selecting one or more of the plurality of transceiver stations to provide the dedicated channels for communications with the first mobile device based on signal measurements, wherein the dynamic selection does not affect the host transceiver providing the broadcast channels.

58. (New) The system of claim 57, wherein the signal measurements are measurements of up-link signals from the first mobile device.

59. (New) The system of claim 57, wherein said host processor receives signal measurements from at least some subset of said plurality of processors, wherein the signal measurements are measurements of up-link signals from the first mobile station;

processes the signal measurements received; and

dynamically selects, based on the processed signal measurements, the one or more of said plurality of transceivers and the associated processors to provide the dedicated channels for the first mobile device.

60. (New) The system of claim 59, wherein said host processor also instructs the one or more of said plurality of transceivers and the associated processors that they are providing the dedicated channels for the first mobile device.

61. (New) The system of claim 57, wherein said plurality of processors are connected together.

62. (New) The system of claim 58, wherein said processor may dynamically change the transceiver station providing the dedicated channels as frequently as frequency of the up-link signals.

63. (New) The system of claim 57, wherein a first set of transceivers can provide uplink communications and a second set of transceivers can provide downlink communications.

64. (New) The system of claim 57, wherein a first set of transceivers can provide traffic signals and a second set of transceivers can provide control signals.

65. (New) A processor for use in a communication system for providing wireless communications with mobile stations, the processor comprising:

a transceiver interface to receive signals from an associated transceiver and to provide instructions to the associated transceiver, wherein the signals received from the associated transceiver include uplink signals from mobile devices;

a controller interface to communicate with a controller, wherein the communications with the controller include assignment of a host transceiver and host processor for a particular mobile device, wherein the host transceiver communicates with the particular mobile device via broadcast channels;

a processor interface to communicate with a plurality of other processors, wherein the communications related to the particular mobile device include receipt of measurement signals

Amendment

-17-

09/750,592

related to the particular mobile station and transmission of instructions if said processor is the host processor, and includes receipt of instructions from a host processor and transmission of measurement signals associated with the particular mobile station to the host processor if said processor is not the host processor;

a signal processor, active for the particular mobile device when said processor is the host processor, to process the measurement signals received from at least some subset of the plurality of other processors and the measurement signal from said processor; and

a selector to dynamically select an assistant processor and associated assistant transceiver to provide communications with the particular mobile device via dedicated channels based on the processed measurement signals.

66. (New) The processor of claim 65, wherein the measurement signals are measurements of up-link signals from the particular mobile device.

67. (New) The processor of claim 65, wherein said selector may dynamically select as frequently as frequency of the up-link signals.

68. (New) The processor of claim 65, wherein said processor may be the host processor for a first mobile device and an assistant processor for a second mobile device.

69. (New) The processor of claim 65, wherein said processor interface for a host processor transmits instructions to an assistant processor to provide the dedicated channels for communication with the particular mobile device when said selector selects the associated assistant transceiver to provide communications with the particular mobile device via the dedicated channels.

70. (New) The processor of claim 65, wherein said processor interface for an assistant processor receives instructions from a host processor to provide the dedicated channels for communication with the particular mobile device when the host processor selects the associated assistant transceiver to communicate with the particular mobile device via the dedicated channels.

71. (New) The processor of claim 65, further comprising a resource manager for controlling radio frequencies of associated transceiver.

72. (New) The processor of claim 65, wherein said host processor can select a first set of transceivers to provide uplink communications and a second set of transceivers to provide downlink communications.

73. (New) The processor of claim 65, wherein said host processor can select a first set of transceivers can provide traffic signals and a second set of transceivers can provide control signals.
